The unemployment rate for adults who are not in the military jumped to 5.9 percent in September, the highest since the beginning of 2010. The unemployment rate for those who are in the service stood at 6.1 percent. The Labor Department reported Tuesday that the unemployment rate climbed for a second straight month from September 2012, and the economy added a meager 33,000 jobs in September. The job loss was led by a loss of 17,000 jobs in the federal government, which was cut back to just nine-week workdays as the government looks for a way to reduce its \$85 billion deficit. Last month, President Barack

Obama signed the most extensive set of budget-cut proposals in years. The move was widely seen as a grim reminder of Washington's inability to restore jobs lost during the recession. The overall rate in September was little changed from August, when the jobless rate climbed to 5.7 percent from 5.6 percent.

Autophagy and the search for molecular targets in cancer therapy. Conventional cancer treatment relies on the delivery of cytotoxic drugs to primary tumours and metastases. The main problem here is that the normal tissue far from the cancerous cells is damaged by the treatment. Autophagy is a genetically programmed catabolic process in which a cell degrades cytoplasmic proteins and damaged organelles in the lysosome and stores the resulting macromolecules in vesicles termed autophagosomes. Autophagy involves the coordinated action of two opposing pathways: (i) macroautophagy that selectively targets cytosolic components for lysosomal degradation, and (ii) microautophagy, a non-selective process that occurs in a non-vesicular manner. Recent studies indicate that an increased autophagic activity is a common

feature of different types of tumours, and there is also a close relationship between autophagy and hypoxia. In fact, autophagy may be a two-faced process for the cell, a cytoprotective mechanism that may contribute to tumour growth or a target for cancer therapy. In this review, we

.Electrochemical migration (ECM) is the premature failure of a conductive printed circuit.SMT Manual Resoldering,Â . . . IPC-TR-476A, Sixth Working Draft, April 1995.. IEEE-STD-1586-1993Electrical Characteristics of.Vest JR, Bolin JN, Miller TR, Gamm LD, Siegrist TE, Martinez LE.. [6]. 10mm to 30mm. IPC-TR-476A, Sixth Working Draft, April 1995.. IPC-TR-476A Electrochemical Migration: Electrically Induced Failures in Printed Wiring Assemblies Standard *

* electrochemical migration (ECM) is the premature failure of a conductive printed circuit board trace or wire due to migration at the interconnections. The IPC standard says:
IMPORTANT NOTE: The documents referred to in this standard are not included in the

Electrochemical migration (ECM) is the premature failure of a conductive printed circuit board trace or wire due to migration at the interconnections. The IPC standard says: The following discussion of ECM is taken from the Sixth version of IPC-476A. Electrochemical migration (ECM) is the premature failure of a conductive printed circuit board trace or wire due to migration at the interconnections. The IPC standard says: ECM is a process by which metal from one part of a circuit migrates into another. ECM is a phenomenon which occurs at the interfaces between different metals. Similarly, ECM is a component of corrosion. The reactions are as follows:

Electrochemical migration (ECM) is the premature failure of a conductive printed circuit board trace or wire due to migration at the interconnections.. The IPC standard says: Electrochemical migration (ECM) is the premature failure of a conductive printed circuit board trace or wire due to migration at the interconnections. The IPC standard says: The following discussion of ECM is taken from the Sixth version of IPC-476A. Electromigration is the migration of metal ions from one metal to

another. .Electrochemical migration (ECM) is the premature failure of a conductive printed circuit board trace or wire due to migration at the interconnections. Electromigration is the
